

@api_client — swallow

Appears in: [DL-05](#)

[shared/api_client.py:81-86](#)

"If the server is down and someone triggers the pipeline straight from the terminal, the approval fails quietly and the decision is lost — @api_client swallows the error."

@api_client — swallow

[shared/api_client.py:81-86](#)

```
81 def queue_approval(item: dict) -> dict:
82     try:
83         r = httpx.post(f"{API_BASE}/api/approvals", json=item, timeout=5.0)
84         return r.json()
85     except Exception:
86         return {"queued": False}
```

What it shows: `queue_approval()` wraps the POST in try/except and returns `{queued: False}` on failure — the silent-loss path called out as a known limit.
