

@betsy — Promise.all

Appears in: **DL-04**

dashboard/betsy.html:1343-1356

"The implementation started with the connection question: how does @betsy talk to the server?" ... "A single Promise.all pulls inventory, suppliers, and the agent log in one shot, same origin, no CORS to fight."

@betsy — Promise.all

dashboard/betsy.html:1343-1356

```
1343     async function refresh() {
1344       try {
1345         const [inventory, suppliers, agentLog, approvals, statsData] = await Promise.all([
1346           get('/api/inventory'),
1347           get('/api/suppliers'),
1348           get('/api/agent-log'),
1349           get('/api/approvals').catch(() => []),
1350           get('/api/stats').catch(() => null),
1351         ]);
1352
1353         const narrative = buildNarrative(inventory, agentLog, approvals);
1354         document.getElementById('narrative-text').textContent = narrative;
1355         document.getElementById('narrative-ts').textContent = 'updated ' + timeAgo(new Date().toISOString());
1356         buildNarrativeActions(approvals);
```

What it shows: `refresh()` pulls inventory, suppliers, agent-log, approvals and stats in one `Promise.all`, same origin. `setInterval(refresh, 5000)` is the five-second poll.
