

@main — scheduler

Appears in: [DL-06](#)

server/main.py:27-40

"The start-up routine in @main starts the scheduler, registers the pipeline job with the chosen interval, and shuts it down on exit."

@main — scheduler

server/main.py:27-40

```
27  @asynccontextmanager
28  async def lifespan(app: FastAPI):
29      interval = int(os.getenv("AGENT_INTERVAL_MINUTES", "30"))
30      scheduler.add_job(
31          _scheduled_run,
32          trigger="interval",
33          minutes=interval,
34          id="betsy_auto_run",
35          replace_existing=True,
36      )
37      scheduler.start()
38      logger.info("Scheduler started – auto-run every %d min", interval)
39      yield
40      scheduler.shutdown(wait=False)
```

What it shows: `lifespan()` adds the `betsy_auto_run` interval job (default 30 min, `AGENT_INTERVAL_MINUTES`), starts the scheduler, and shuts it down on exit.
