

@orders — notify

Appears in: [DL-08](#)

server/routers/orders.py:64-65, 106-112

"...the orders router sends the score-drop alert only on the first crossing of the warning line ..." and "...the orders router sends the auto-order alert when the order came from the pipeline itself ..."

@orders — notify

server/routers/orders.py:64-65

```
64     if po.requested_by == "betsy-pipeline":
65         notifier.notify_auto_approved(order)
```

...

server/routers/orders.py:106-112

```
106     if new_score < config.SCORE_DROP_THRESHOLD and old_score >= config.SCORE_DROP_THRESHOLD:
107         notifier.notify_score_drop(
108             supplier_name=supplier["name"],
109             old_score=old_score,
110             new_score=new_score,
111             po_id=order["po_id"],
112         )
```

What it shows: The two order-side triggers: auto-approved-PO alert, and the score-drop alert gated on `new < threshold` and `old >= threshold` (crossing, not every late delivery).
