

@scheduler_instance

Appears in: [DL-06](#)

server/scheduler_instance.py:1-3

"...a tiny @scheduler_instance module to solve a circular-import problem ..." ... "The scheduler lives in its own three-line module, @scheduler_instance, rather than in @main."

@scheduler_instance

server/scheduler_instance.py:1-3

```
1  from apscheduler.schedulers.background import BackgroundScheduler
2
3  scheduler = BackgroundScheduler()
```

What it shows: The three-line singleton (`scheduler = BackgroundScheduler()`) that both `main` and `stats` import — breaking the circular import cleanly.
