

@state — reset bug

Appears in: **DL-05**

server/state.py:36-41

"I traced it to the reset() function in @state — one line was wiping the approvals at the end of every pipeline run ..." ... "Removing that single line fixed it."

@state — reset bug

server/state.py:36-41

```
36     def reset(self):
37         self._current = deepcopy(self._base)
38         self.agent_log = []
39         self.active_scenario = "normal"
40         from server import db as _db
41         _db.clear_log()
```

What it shows: reset () clears the scenario state and agent log — but must **not** touch self.approvals (those are user-facing decisions, not mock data). The removed line was the bug.
