

@suppliers-router

Appears in: [DL-07](#)

server/routers/suppliers.py:21-29

"...so I added a dedicated endpoint for setting supplier scores and called it explicitly after each scenario injection — deterministic, with no parsing ambiguity." (footer @suppliers-router)

@suppliers-router

server/routers/suppliers.py:21-29

```
21 @router.patch("/{supplier_id}/score")
22 def update_supplier_score(supplier_id: str, reliability_score: float):
23     for sup in state.suppliers:
24         if sup["supplier_id"] == supplier_id:
25             old = sup["reliability_score"]
26             sup["reliability_score"] = round(max(0.0, min(1.0, reliability_score)), 4)
27             return {"supplier_id": supplier_id, "name": sup["name"],
28                   "old_score": old, "new_score": sup["reliability_score"]}
29     raise HTTPException(status_code=404, detail=f"Supplier {supplier_id} not found")
```

What it shows: The dedicated score-setting endpoint added in DL-07 so learned scores can be restored deterministically before run #2.
