

@orchestra-state

Appears in: **DL-02**

orchestra/state.py:5-22

(same typed-state sentence as above)

@orchestra-state

orchestra/state.py:5-22

```
5  class OrchestraState(TypedDict):
6      # Situation brief -- filled by build_brief node
7      brief: dict    # {inventory, suppliers, all_pos, open_pos, invoices}
8
9      # Agent findings -- filled by each analysis agent
10     inventory_findings: List[dict]
11     supplier_findings: List[dict]
12     invoice_findings: List[dict]
13
14     # Orchestration output
15     all_findings: List[dict]
16     conflicts: List[dict]
17     decisions: List[dict]
18     actions: List[dict]
19
20     # Final
21     report: str
22     errors: Annotated[List[str], operator.add]
```

What it shows: The OrchestraState TypedDict — the parallel-pattern equivalent (brief + per-agent findings + conflicts/decisions).
