

@approvals — notify

Appears in: [DL-08](#)

server/routers/approvals.py:28-33

"...the approvals router sends the approval notification the moment the item is saved, with the action mapped to a readable label ..."

@approvals — notify

server/routers/approvals.py:28-33

```
28     # Fire desktop + email notification for the queued item.
29     # All action types (generate_po, flag_duplicate, flag_for_approval, escalate)
30     # use the same approval notification; the action label differentiates them.
31     notifier.notify_approval_required(item)
32
33     return item
```

What it shows: The single point that fires the desktop+email approval alert as an item is saved to the queue.
