"SQLite persistence through a new @db module using Python's built-in database support ..." ... "All writes go through one lock in @db."

@db

server/db.py:7-46

```
7  DB_PATH = Path(__file__).parent.parent / "betsy.db"
8  _lock = threading.Lock()
9
10
11 def _conn() -> sqlite3.Connection:
12     c = sqlite3.connect(str(DB_PATH), check_same_thread=False)
13     c.row_factory = sqlite3.Row
14     return c
15
16
17 def init_db() -> None:
18     with _lock, _conn() as c:
19         c.executescript("""
20             CREATE TABLE IF NOT EXISTS agent_log (
21                 id            INTEGER PRIMARY KEY AUTOINCREMENT,
22                 timestamp     TEXT NOT NULL,
23                 trigger       TEXT NOT NULL,
24                 analysis       TEXT NOT NULL,
25                 decision       TEXT NOT NULL,
26                 confidence     REAL NOT NULL DEFAULT 0.0,
27                 metadata       TEXT NOT NULL DEFAULT '{}'
28             );
29
30             CREATE TABLE IF NOT EXISTS approvals (
31                 id            INTEGER PRIMARY KEY AUTOINCREMENT,
32                 decision_id    TEXT UNIQUE NOT NULL,
33                 status         TEXT NOT NULL DEFAULT 'pending',
34                 action         TEXT NOT NULL,
35                 sku_id         TEXT,
36                 supplier_id    TEXT,
37                 po_total       REAL,
38                 qty            INTEGER,
39                 unit_price     REAL,
40                 confidence     REAL NOT NULL DEFAULT 0.5,
41                 reasoning      TEXT,
42                 payload        TEXT,
43                 created_at     TEXT NOT NULL,
44                 resolved_at    TEXT
45             );
46         """)
```

What it shows: The SQLite persistence module — one `threading.Lock` guarding all writes, two tables created on first start, no external service.
