@main — run-agent

server/main.py:78-87

```
78 @app.post("/api/run-agent", tags=["agent"])
79 def run_agent(background_tasks: BackgroundTasks, scenario: str = "", mode: str = "pipeline"):
80     def _run():
81         if mode == "orchestra":
82             from orchestra.run import run_full
83         else:
84             from pipeline.run import run_full
85         run_full(scenario=scenario or None)
86         background_tasks.add_task(_run)
87     return {"status": "started", "mode": mode, "scenario": scenario or "normal"}
```

What it shows: POST /api/run-agent hands the pipeline to FastAPI BackgroundTasks and returns immediately, so the browser does not hang on the model call.
