

Test Report -- DL-05 HITL Approval Queue

Branch: feat/dl05-approvals Date: 2026-05-31 Tester: automated via curl against live server (uvicorn, port 8000)

What was tested

The full approve/decline loop introduced in DL-05: - GET /api/approvals returns pending items - Pipeline queues requires_human=True decisions to /api/approvals - POST /api/approvals/{id}/approve creates the PO and logs human_approved - POST /api/approvals/{id}/reject logs human_rejected, no action taken - Guard rails: double-resolve and unknown-id are rejected cleanly

Bug found during testing

Root cause: state.reset() included self.approvals = [], which was added when wiring up the reset flow. The pipeline calls api.reset_scenario() at the end of every run -- so approvals were being queued and then immediately wiped.

Fix: Removed self.approvals = [] from reset(). Approvals are user-facing decisions that live until Jenny acts on them -- they are independent of scenario state. Committed separately: fix: don't clear approvals on scenario reset.

Test results

#	Test	Expected	Result	Pass
T1	GET /api/approvals before any run	[]	[]	?
T2	Trigger stockout_warning pipeline via /api/run-agent	{"status":"started"}	{"status":"sta	
T3	GET /api/approvals after run	2 pending items (generate_po + flag_duplicate)	2 items -- 1	
T4	POST /api/approvals/{id}/reject on duplicate flag	{"status":"rejected"}	{"status":"reje	
T5	POST /api/approvals/{id}/approve on generate_po	{"status":"approved","po_id":"..."}	{"st	
T6	GET /api/approvals after both resolved	[]	[]	?
T7	PO PO-20260531-0E74 in /api/purchase-orders	requested_by: betsy-human-approved	Present w	
T8	Agent log contains human_approved and human_rejected entries	2 entries with correct metadata		
T9	Re-approve an already-resolved item	400	400	?
T10	Approve non-existent decision_id	404	404	?
T11	duplicate_invoice scenario queues flag items	flag_duplicate items pending	3 × flag_dupl	

11/11 passed.

Observations

PO created correctly: The approved PO was created with requested_by: betsy-human-approved, distinguishing human-approved orders from auto-approved ones in the purchase orders list.

Agent log records the human decision: Both human_approved and human_rejected entries appear in the agent log with the decision_id, making it auditable -- you can trace every approval action back to the queued decision.

Financial safeguard held: The stockout_warning PO total was ?11,325 (above the ?5,000 auto-approve limit). The agent correctly stopped and queued it. The human approved it and the PO was created -- so the safeguard is blocking auto-action but not blocking human action. That's the intended behaviour.

T11 note: The duplicate_invoice scenario produced 3 pending flag_duplicate items for SKU-004. This is expected -- the scenario injects multiple duplicate invoice pairs and the detect node finds each one independently. Not a bug.

What this enables

- Jenny can now open betsy.html, see approval cards, and click "Yes, go ahead" or "Skip this"
- Approving a generate_po creates the PO in real-time -- visible in index.html orders tab immediately
- Every approval/rejection is recorded in the agent log with full traceability
- The betsy.html decision log section shows ? You approved / ? You declined entries after acting
