

Betsy -- User Requirements

Design Philosophy

Betsy is a layer on top of the procurement environment, not a replacement. The underlying procurement system (orders, invoices, suppliers) stays as-is. Betsy monitors it, flags issues, and makes recommendations -- humans stay in control.

Users

Primary -- Operations Manager (Jenny) - 0 tech background - Currently spends 30+ hours/week on procurement firefighting - Needs: quick view of what needs attention, ability to approve/reject agent decisions, confidence that Betsy won't make costly mistakes

Secondary -- Finance Team - Needs: audit trail of all autonomous decisions, cost visibility, duplicate invoice alerts

Tertiary -- Production/Assembly - Needs: reassurance that materials won't run out, no direct interaction with Betsy

Language Rules (non-negotiable)

- No system jargon anywhere in the UI -- no trigger, confidence_score, EMA, pipeline
 - Betsy speaks in first person: "I ordered...", "I'm not sure about...", "I flagged..."
 - Confidence shown as filled dots (?????) not floats (0.87)
 - Status labels in plain English: "needs your OK" not pending_approval
 - Reasons written as short plain sentences: "Stock was running low -- 2 days left" not stockout_risk: days_remaining=2
-

Screens

1. Home

Purpose: Quick health check at a glance. Jenny opens this in the morning. Must show: - How many items need her approval (with shortcut to screen 2) - How many things Betsy handled automatically (no action needed) - How many critical alerts exist - Last 3-5 activity items in plain English - When Betsy last checked inventory

Must NOT show: - Technical agent internals - Raw data tables - Any number that requires explanation

2. Pending Approvals (HITL core)

Purpose: The place where humans stay in control. Every item here is something Betsy chose NOT to do autonomously. Must show per item: - What's happening (plain English, 1-2 sentences) - What Betsy would normally do - Why she's asking instead of acting (the reason she's unsure) - What it costs (if a purchase is involved) - Betsy's confidence level (dots, not float) - Two clear actions: approve / decline

UX rules: - Each item is a card, not a table row -- cards feel more human - Approve/decline must be impossible to confuse with each other - After approval: item disappears, brief confirmation shown - If queue is empty: show a positive "nothing needs your attention" state

3. Agent Log

Purpose: What did Betsy do in the last N days? Full readable history. Must show: - Grouped by day - Each entry: what happened, what it cost (if anything), how long ago - Color coded: auto-handled (green), human-approved (blue), flagged/declined (orange/red) - Expandable detail per entry with the full plain-English reasoning

Must NOT show: - LangGraph node names - Raw JSON payloads - Confidence as a decimal

4. Supplier Scoreboard

Purpose: How are our suppliers performing? Is anyone becoming unreliable? Must show: - Supplier name, track record (dots), typical delivery speed, last order date - Visual warning if a supplier has an open issue (e.g. duplicate invoice) - Note that track record "updates automatically after each delivery" -- makes the learning visible without explaining EMA

Functional Requirements

#	Requirement	Priority
F1	Agent decisions persist across server restarts	High
F2	Approval queue shows items until human acts on them	High
F3	Approve action triggers PO creation automatically	High
F4	Decline action logs reason and closes item	High
F5	Agent runs on a schedule without manual trigger	High
F6	Supplier track record updates after each delivery	Medium
F7	Expandable reasoning per log entry	Medium
F8	Finance can export/audit all decisions	Low

Non-Functional Requirements

#	Requirement
N1	Zero setup for end user -- open browser, it works
N2	Any decision Betsy makes autonomously must be logged with a plain-English reason
N3	No autonomous action above \$25,000 -- always requires human
N4	If Betsy is offline or erroring, the procurement environment continues normally
N5	Every approval/rejection is timestamped and attributed

What This Is NOT

- Not a replacement for the ERP or procurement system
- Not a tool for suppliers to interact with
- Not a reporting/analytics platform (that's a future version)
- Not something IT needs to babysit
